Data: Commonwealth Fund Health Care Poll: COVID-19, May-June 2020.

## HOW WE CONDUCTED THIS SURVEY

The Commonwealth Fund Health Care Poll: COVID-19, MayJune 2020 was conducted by SSRS from May 13 through June 2, 2020. A total of 2,271 interviews were completed on the SSRS Omnibus. The survey was completed with the general population (adults 18 and older) and included an oversample of African Americans and Hispanics. ${ }^{1}$ Approximately, 28 percent of the interviews were completed via landline ( $n=626$ ) and 72 percent of the interviews were conducted via mobile phone ( $n=1,645$ ).

This study asks respondents about changes in their employment and health insurance coverage, as well changes in the respondent's partner/spouse's employment and health insurance coverage, during the coronavirus pandemic. The unit of analysis is at the household level. "Household," in this study, is defined as the respondent and the respondent's partner/spouse. If both the respondent and partner/spouse had a change in employment, for example, we would consider this as one employment change for the household.

In total, 221 respondents reported they lost their job or were furloughed and their partner/spouse did not, 82 respondents said their partner/spouse lost their job or were furloughed and the respondent did not, and 30 respondents reported that both they and their partner/ spouse lost their job or were furloughed. Of all respondents who reported they or their partner/spouse lost a job/ furloughed, 60 respondents reported they had coverage through their own affected job and their partner/spouse (if married/living with a partner) did not, 25 respondents reported their partner/spouse had coverage through the partner/spouse's affected job and the respondent did not, and 53 respondents reported both the respondent and
partner/spouse had coverage through either their own or their partner/spouse's affected job.
Each Omnibus survey consists of a minimum of 1,000 interviews, of which 700 interviews are completed with respondents on their cell phones and at least 35 are conducted in Spanish. Completes are representative of the United States population of adults 18 and older. The SSRS Omnibus uses a fully-replicated, stratified, singlestage, random-digit-dialing (RDD) sample of telephone households, and randomly generated cell phones.

Each SSRS Omnibus insert was weighted to provide nationally representative and projectable estimates of the adult population 18 years of age and older. The first stage weight or base weight took into account the disproportionate probabilities of household and respondent selection due to the number of separate telephone landlines and cell phones answered by respondents and their households, as well as the probability associated with the random selection of an individual household member. With the base weight applied, the sample was post-stratified and balanced by key demographics such as age, race, sex, region, and education. The sample was also weighted to reflect the distribution of phone usage in the general population. The study included an oversample of African American and Hispanic respondents. The weighting procedures adjusted for this oversampling.

The margin of error for this survey is $+/-2.4$ percentage points. The landline portion of the survey achieved a 3.9 percent response rate and the cellular phone component achieved a 3.5 percent response rate. The overall response rate was 3.6 percent.

[^1]
[^0]:    Notes: "Other" race includes Asians, Native Americans/American Indians, Alaska Natives, Native Hawaiians, Pacific Islanders, mixed race, and any other race. "Some college" includes adults who reported they attended college but did not graduate, or they earned a two-year associate degree. "Metro" includes respondent living in a city or suburban area. Adults who reported they considered themselves an "Independent," "Other," or reported "Don't know/refused" were then asked if they lean more toward the Democratic or Republican Party. "Independent," "Other," and "Don't know/refused" categories are not listed.

[^1]:    1. This survey was included in the SSRS Omnibus for three weeks. To collect these 2,271 interviews, each week all African Americans and Hispanics were interviewed. Of the remaining respondents surveyed in the Omnibus, we completed interviews with seven out of every nine respondents age 18 and older for the first week. For the last two weeks, this number was decreased to ask six out of every nine respondents.
