Health Equity Scorecard: Teleconference Slides
Introduction

Racial and ethnic inequities in health and health care are long-standing, are rooted in the structural racism embedded in U.S. policies, and have been exacerbated during the pandemic.

The Commonwealth Fund’s *Scorecard on State Health System Performance* series has long tracked the functioning of each state’s health care system, but state averages can mask profound underlying inequities among different people.

This tool will allow policymakers to understand the magnitude of health inequities and establish attainable benchmarks for reducing disparities.
How We Created the State Equity Scorecard Report

The report uses 24 data indicators drawn from our *State Scorecard*, representing aspects of health system performance that can be stratified by race/ethnicity.

The report features measures for five racial and ethnic groups: Black, white, American Indian/Alaska Native (AIAN), Asian American, Native Hawaiian, and Pacific Islander (AANHPI), and Latinx/Hispanic.

Data from 2019 and 2020.

Measures are grouped into three dimensions: Health Outcomes, Health Care Access, Quality and Use of Health Care Services.

Composite summary scores calculated for each group within each state (e.g., Black residents in Texas) by aggregating performance measure data.
Key Findings

Health equity does not exist in any state within the U.S., even those with stronger health systems.

In every state, health system performance is markedly worse for many people of color, particularly Black, Latinx, and AIAN populations, when compared to white people.

Only six states had above-average performance for all racial and ethnic groups (for which data were available): Connecticut, Hawaii, Massachusetts, New York, Oregon, and Rhode Island.

Some Midwest states like Minnesota and Wisconsin have historically performed strongly in the State Scorecard series, but they report some of the largest racial inequities between groups.

Others like Mississippi and Oklahoma show substandard performance for all groups, but still report sizable inequities within the state.
Health system performance for white people is above average in most states.

Notes: States are rank-ordered by highest state performance for white population. Grey dots represent the highest score achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the top score). Height of the point represents state performance on a 1-100-point scale, with the centerline marking average performance (equivalent to the all-group median at the 50th percentile) among all the groups measured. Summary performance scores not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Data: Commonwealth Fund 2021 Health System Performance Scores.
Health system performance among Black people is below average in most states and much worse than the best achieved in all states.

Notes: States are rank-ordered by highest state performance for Black population. Grey dots represent the highest score achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the top score). Height of the point represents state performance on a 1-100-point scale, with the centerline marking average performance (equivalent to the all-group median at the 50th percentile) among all the groups measured. Summary performance scores not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Data: Commonwealth Fund 2021 Health System Performance Scores.
Summary Findings

Health system performance among Latinx/Hispanic people is below average in most states and much worse than the best achieved in all states.

Notes: States are rank-ordered by highest state performance for Latinx/Hispanic population. Grey dots represent the highest score achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the top score). Height of the point represents state performance on a 1-100-point scale, with the centerline marking average performance (equivalent to the all-group median at the 50th percentile) among all the groups measured. Summary performance scores not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Data: Commonwealth Fund 2021 Health System Performance Scores.
Six states with better-than-average and three states with below-average health system performance for all groups; within-state disparities exist in each.

Notes: Only states with sufficient data for at least two racial and ethnic groups included. Height of the point represents state performance on a 1-100-point scale, with the centerline marking average performance (equivalent to the all-group median at the 50th percentile) among all the groups measured. Summary performance scores not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state. AANHPI = Asian American, Native Hawaiian, and Pacific Islander; AIAN = American Indian/Alaska Native.

Data: Commonwealth Fund 2021 Health System Performance Scores.

Many states have strong performance for some racial and ethnic groups, but still face large disparities (six examples).

Notes: Only states with sufficient data for at least two racial and ethnic groups included. Height of the point represents state performance on a 1-100-point scale, with the centerline marking average performance (equivalent to the all-group median at the 50th percentile) among all the groups measured. Summary performance scores not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state. AANHPI = Asian American, Native Hawaiian, and Pacific Islander; AIAN = American Indian/Alaska Native.

Data: Commonwealth Fund 2021 Health System Performance Scores.

Health Outcomes
In most states, Black people are more likely to die early in life from conditions that are treatable with timely access to high-quality health care.

Notes: Grey dots represent the lowest mortality rate achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the lowest rate). The centerline marks the U.S. premature mortality rate for all people. Data not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Data: CDC, 2018 and 2019 National Vital Statistics System (NVSS), All-County Micro Data, Restricted Use Files.
In most states, AIAN people are more likely to die early in life from conditions that are treatable with timely access to high-quality health care.
Health Care Access
Although the ACA’s coverage expansion improved inequities, state uninsured rates are generally higher for Latinx/Hispanic adults.

Notes: Grey dots represent the lowest uninsured rate achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the lowest rate). The centerline marks the U.S. uninsured rate for all people. Data not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Although the ACA’s coverage expansion improved inequities, state uninsured rates are generally higher for Black adults.

Notes: Grey dots represent the lowest uninsured rate achieved in each state by any of the five groups (if no grey dot is visible, the highlighted group has the lowest rate). The centerline marks the U.S. uninsured rate for all people. Data not available for all racial and ethnic groups in all states; missing dots for a particular group indicate that there are insufficient data for that state.

Summary

State health systems are not working for many people of color.

Racial and ethnic disparities in health and health care are evident in every state, even those with stronger health systems.

Health system performance is markedly worse for many people of color, particularly Black, Latinx, and AIAN populations, when compared to white people.
Using the Scorecard — more than just a report . . .

Online interactive content and printable PDF

A new tool that identifies differential health system performance between racial and ethnic groups

Provides insight across and within states

State and racial and ethnic group profiles provide focused detail with summary information and data points for all 24 indicators
State Profiles

Performance scores and group-specific ranks for each of the five racial and ethnic groups

Performance scores on each of the three dimensions to help target areas of relative strength or weakness

State-specific data for each indicator

Health system performance expressed as 1-100 percentiles, based on 5 racial and ethnic groups in each state. Higher scores reflect better performance, and center line is median performance among all groups. Highlighted point is state’s health system performance for Black people; grey point is highest score for any group in the state. Scores for Black race not available for: AK, HI, ID, ME, MT, NH, NM, ND, OK, SD, UT, VT, WY.

The Commonwealth Fund
Achieving health equity requires policy action.

Ensuring universal, affordable, and equitable health coverage

Strengthening primary care and improving the delivery of services

Improving the collection and analysis of racial and ethnic data to identify gaps and develop equity-focused measures to inform and evaluate policy

Reducing inequitable administrative burdens affecting patients and providers

Investing in social services
